

Twinfoiks Admin Panel - Usage Instructions

Overview

The new integrated admin panel combines the wreath database editor and JSON merger into one streamlined interface. This eliminates the need for separate HTML files and provides a complete workflow for managing your wreath inventory.

Setup Instructions

1. Replace Your Current Admin Files

Replace these files in your website folder:

- `admin.html` → Use the new integrated admin panel
- `js/admin-integrated.js` → New JavaScript file (create this in your js folder)

2. Keep Your Security Settings

The admin panel still uses the same `ADMIN_PASSWORD` system that's secured via Netlify environment variables. No changes needed to your security setup.

How to Use the Admin Panel

Step 1: Login

1. Go to `your-site.netlify.app/admin.html`
2. Enter your admin password
3. The system will automatically load your current wreaths data

Step 2: Import New Items (Optional)

1. Click "Import JSON Files" in Step 2
2. Select multiple Poshmark JSON files from your Chrome extension
3. The system automatically merges them with existing data
4. Duplicates are handled automatically (updated if same ID)

Step 3: Edit & Manage Wreaths

1. Use the table to view all wreaths
2. Click the edit icon (pencil) to modify any wreath
3. Toggle sold status with checkboxes

4. Add new wreaths manually with "Add New Wreath"
5. Set prices, descriptions, hashtags, and platform URLs

Step 4: Export Updated Database

1. Click "Export wreaths.json" when done editing
2. This downloads your updated database file
3. Upload this file to replace the old wreaths.json on your website

Key Features

✓ Automatic Data Loading

- Loads current wreaths.json automatically when you login
- No need to manually download and upload files

✓ Integrated JSON Merger

- Import multiple Poshmark JSON files at once
- Automatic duplicate detection and handling
- No need for separate merger tool

✓ Full Wreath Editor

- Edit all wreath properties in one place
- Image management with URL support
- Platform linking (Poshmark, Facebook, Mercari, etc.)
- Hashtag management

✓ Smart Workflow

- Visual workflow steps show your progress
- Unsaved changes indicator
- Auto-save to memory during editing

✓ Security Maintained

- Same password protection as before
- Session management for convenience
- Logout warning if unsaved changes

Image Management Tips

Getting Image URLs:

1. **Imgur (Recommended):** Upload → Right-click → "Copy image address"
2. **Cloudinary:** Upload → Copy provided URL
3. **Phone Photos:** Upload to Imgur first, then copy URL

Avoid:

- Google Photos links (they break often)
- Facebook image links (not permanent)
- Local file paths (won't work online)

Workflow Best Practices

Daily Routine:

1. Login to admin panel
2. Import any new Poshmark JSONs
3. Update prices on new items (they default to \$0)
4. Mark sold items as sold
5. Export and upload updated database

Weekly Maintenance:

1. Review and update descriptions
2. Add missing hashtags
3. Update platform URLs
4. Clean up old sold items if needed

Troubleshooting

"Failed to load wreaths data"

- Normal if this is your first time or wreaths.json doesn't exist
- The system will start with an empty database
- Just start adding wreaths manually or importing JSONs

Import Errors

- Check that JSON files are from the Poshmark Chrome extension
- Ensure files aren't corrupted
- Try importing one file at a time if bulk import fails

Images Not Showing

- Verify image URLs are correct and publicly accessible
- Use Imgur or similar image hosting service
- Avoid using local file paths or temporary links

Unsaved Changes Warning

- Always export your data before leaving the admin panel
- The browser will warn you if you have unsaved changes
- Your edits are stored in memory until exported

File Structure

Your website should have:

```
website/
├── admin.html      (new integrated admin panel)
├── js/
│   └── admin-integrated.js  (new JavaScript file)
├── wreaths.json    (your data file)
└── index.html      (your main website)
```

Security Notes

- Password is still secured via Netlify environment variables
- Admin panel works offline for editing (data loads from your live site)
- No database costs - everything stays file-based
- Session expires when you close browser (for security)

Support

If you encounter issues:

1. Check browser console for error messages
2. Ensure wreaths.json exists and is accessible

3. Verify admin password is correct
 4. Try refreshing the page and logging in again
-

Happy wreath managing! 🌿 Your wife now has a powerful, user-friendly tool to manage the entire inventory from one interface.
